INTRODUCTION

Preamble

260.001.000
PURPOSE OF GUIDELINE

This Health Planning Unit (HPU) has been developed for use by project staff (architects, planners, engineers, project managers and other consultants) and for end users, to facilitate the process of planning and design.

It is intended to assist with the planning and design of a unit that will be fit for purpose in accordance with its designated service delineation / capability and defined catchment population.

260.001.005
It is a new HPU written for Australasian use in 2010 and further reviewed and updated in 2011. Its development has been informed by an extensive background research and consultation process.

Introduction

260.002.000
GENERAL

This HPU outlines the requirements for a Coronary Care Unit (CCU) including the additional facility requirements for treating cardiac patients (medical and surgical) in a medical or cardiac inpatient unit.

It should be read in conjunction with the Australasian Health Facility Guidelines (AusHFG) generic requirements and Standard Components described in:

- Part A - Introduction and Instructions for Use;
- Part B - Section 80 - General Requirements;
- Part B - Section 90 - Standard Components;
- Part C - Design for Access, Mobility, OHS and Security;
- Part D - Infection Prevention and Control; and
- Part E - Building Services and Environmental Design.

For general information regarding general inpatient unit planning and design, it is recommended that this HPU be read in conjunction with Part B: HPU 340 Inpatient Accommodation Unit, Australasian Health Facility Guidelines (AHIA, 2010).

In situations where the CCU is a component of an Intensive Care or High Dependency Unit, refer to Part B: HPU360 Intensive Care - General, Australasian Health Facility Guidelines (AHIA, 2014).

This HPU should be read in conjunction with HPU 170 Cardiac Investigation Unit that addresses the following investigative and diagnostic components of a cardiac service:

- electrocardiography (ECG);
- echocardiography;
- ambulatory monitoring – Holter and blood pressure; and
- outpatient/ambulatory care clinics.

260.002.005
For the purposes of this guideline, services are defined as primary, secondary and tertiary level. Refer to Operational Models for descriptions of models of care associated with secondary and tertiary level services. Refer also to specific jurisdictional service definitions; role delineations; and capability statements for application to specific projects.
260.002.010 PRIMARY SERVICES
Primary cardiac services may be delivered in small rural hospitals; Multipurpose Service centres (MPS); general practices; and community health clinics, and in the home using telehealth technology.

Rural healthcare facilities and MPS' will require facilities for patient assessment; stabilisation; initial treatment; and short term monitoring prior to transfer to a larger centre. Service links to other centres may be enhanced considerably by telemedicine links for remote monitoring.

260.002.015 SECONDARY AND TERTIARY SERVICES AND FACILITIES
The range of cardiac services to be provided in the CCU itself, and in an adjoining inpatient unit, need to be carefully defined on a project by project basis within the context of a pre-determined service plan and level of service capability.

Options include:
- a dedicated CCU, plus acute step-down beds for monitoring of patients with acute coronary disease, heart failure or life-threatening arrhythmias; and
- possible adjacent beds for cardiac surgery patients (pre and post-operative management).

All units will require access to:
- a range of cardiac investigations depending on the level of service;
- an inpatient and outpatient cardiac rehabilitation program; and
- 'Hospital in the Home' and outreach services.

260.002.020 CARDIAC SURGERY
Historically cardiac surgery has been closely aligned with thoracic and vascular surgery, and cardiac investigations have been largely non-invasive. As cardiac investigations have become more invasive in nature, 'endovascular surgery' is a term increasingly used in many tertiary centres to define the procedures at the point of convergence between the historically separate disciplines: cardiac surgery and cardiac investigations.

260.002.025 Facility requirements for cardiac surgery (intensive care; high dependency beds; operating rooms; and support) are addressed in the Part B: HPU360 Intensive Care - General, Australasian Health Facility Guidelines (AHIA, 2014) and Part B: HPU520 Operating Unit, Australasian Health Facility Guidelines (AHIA, 2010) and are excluded from this HPU.

Consideration should be given to the location of inpatient beds, staff offices and clinic needs, in relation to their medical counterparts, to enable access to cardiac diagnostic and rehabilitation services and facilities, and to allow the possible sharing of facilities if beds can be collocated.

Policy Framework

260.003.000 GENERAL
Policies for the provision of healthcare services are formulated in accordance with the following principles:
- appropriate service models that ensure a comprehensive service network throughout state and regional health jurisdictions;
- provision of a safe and efficient environment that minimises risk to all users of the facility;
- deployment of resources in a fair and cost effective manner to optimise health outcomes; and
- development and support for enhanced information systems to monitor, plan and evaluate healthcare services.

**260.003.005 DIVERSITY AND SPECIAL GROUPS**

Policy frameworks recognise the diversity of our community. Special groups within the community often require special consideration to meet their needs and to enhance the effectiveness of any services provided.

These groups include:
- Aboriginal and Torres Strait Islanders, and in New Zealand Maori and Pacific Islanders (Aboriginal Mental Health and Well Being Policy 2006-2010 (NSW Health, 2007));
- people living in rural and remote areas;
- children and adolescents;
- people including overweight and bariatric (obese) people who may not necessarily be patients (Occupational Health & Safety Issues Associated with Management Bariatric (Severely Obese) Patients (Employee Relations, NSW Health, 2005));
- people with sensory and cognitive disabilities;
- people from culturally and linguistically diverse backgrounds; and
- older people and the frail aged.

**260.003.010 OVERARCHING POLICIES**

Also refer to individual jurisdiction policies and service planning guidelines in the References and Further Reading sections of this HPU.

**Description of the Unit**

**260.004.000 DESCRIPTION OF CORONARY CARE HEALTH PLANNING UNIT (HPU)**

A CCU is a specially staffed and equipped section of a healthcare facility for the support, monitoring and treatment of highly dependent patients with medical or surgical cardiac conditions, which are life threatening or potentially life-threatening.

**260.004.005 SERVICES PROVIDED**

Depending on the level of the service (tertiary or secondary) and treatments provided,
they may include:
- cardiac monitoring: may be invasive and non-invasive; hard wired with or without telemetry;
- invasive haemodynamic monitoring;
- co-ordination and administration of appropriate drug therapies including thrombolysis;
- non-invasive ventilation (CPAP, BiPAP);
- haemodialysis;
- elective cardioversion;
- intra-aortic balloon counter-pulsation;
- transthoracic echocardiography (TTE) - may be performed at the bedside in the process of cardiac rehabilitation;
- exercise stress testing and management of patients with temporary pacing wires; and
- discharge planning and patient education/rehabilitation.

260.004.015 PATIENT CHARACTERISTICS

Patients will include adults of all ages, acuity, frailty and disability, and increasingly patients with co-morbidities.

Each component of the Unit will need to be able to manage bariatric patients.

Cardiac inpatients have special needs in that they are often fully aware of their surroundings but may be restless, distressed and agitated and may require immediate and critical emergency care.

260.004.020 FUTURE TRENDS

The services provided by a CCU, particularly in the tertiary setting, are evolving as therapies improve. Such advances are reducing the number of patients with significant cardiac damage resulting from a cardiac event such as a heart attack, and as a result, the length of stay in coronary care is decreasing.

The CCU is now the setting for the administration of more complex drugs and therapies. Patients are being transferred to step-down facilities earlier.

However, there is an increasing need for monitoring services to be provided to patients in an adjacent cardiac inpatient unit due to greater levels of complications from cardiac rhythm disturbances. This requires a blend of services to be provided by the CCU and the cardiac inpatient unit.

260.004.025 Future trends may also address:
- the changing role of coronary care and cardiology services, with special regard to the use of cardiac care beds for non-infarct patients, such as those with unstable angina and those recovering after cardiac procedures; and
- the need to link acute coronary care beds to transitional or step-down beds to form integrated CCUs.

260.004.030 Heart failure programmes have resulted in increased survival rates. This has realised cost savings in terms of reduced admission rates. However, the possibility of heart failure increases with age and with the incidence of diabetes. As the general population ages, more patients will require assessment and treatment.

Heart failure treatments are becoming more complex resulting in greater levels of ambulatory and inpatient care for heart failure. Reliance on cardiology specialist staff and diagnostic tests is also increasing.
## PLANNING

### Operational Models

<table>

<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>260.005.000</td>
<td><strong>HOURS OF OPERATION</strong></td>
</tr>
<tr>
<td>603379</td>
<td>The CCU will provide service 24 hours a day, seven days a week.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>260.005.005</td>
<td><strong>MODEL OF CARE - SECONDARY</strong></td>
</tr>
<tr>
<td>603380</td>
<td>In smaller healthcare facilities, the CCU may be combined with other critical care units such as high dependency (HDU) and intensive care units (ICU) for purpose of optimising the utilisation of staff skills and equipment. All secondary units should provide the following:</td>
</tr>
<tr>
<td></td>
<td>- invasive and non-invasive monitoring;</td>
</tr>
<tr>
<td></td>
<td>- resuscitation and stabilisation of emergencies until transfer or retrieval to a higher level facility can be arranged;</td>
</tr>
<tr>
<td></td>
<td>- telemetry for patients who do not require transfer / retrieval to a higher level facility;</td>
</tr>
<tr>
<td></td>
<td>- access to a range of cardiac investigations;</td>
</tr>
<tr>
<td></td>
<td>- access to a service providing cardiac catheterisation; and</td>
</tr>
<tr>
<td></td>
<td>- inpatient and outpatient counselling; information; education; prevention; and rehabilitation services and programmes.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>260.005.010</td>
<td><strong>MODEL OF CARE - TERTIARY</strong></td>
</tr>
<tr>
<td>603381</td>
<td>A comprehensive service is assumed, with possibly a ‘hub and spoke’ arrangement linking major cardiac centres with secondary units and primary care providers, thus ensuring a continuum of patient care. Facilities may or may not be collocated depending on the overall size of the service and building restrictions. The CCU component would:</td>
</tr>
<tr>
<td></td>
<td>- be a discrete unit usually associated with a designated cardiac inpatient unit with step-down and telemetry beds for monitoring of patients with acute coronary syndrome, heart failure or life-threatening arrhythmias;</td>
</tr>
<tr>
<td></td>
<td>- provide the full range of invasive and non-invasive monitoring for cardiac patients, with access to the full range of cardiac investigations and 24 hour on call echocardiography, angiography, angioplasty and permanent pacemaker services;</td>
</tr>
<tr>
<td></td>
<td>- have an inpatient and outpatient cardiac rehabilitation programme; and</td>
</tr>
<tr>
<td></td>
<td>- provide Hospital in the Home, outreach and remote monitoring services.</td>
</tr>
</tbody>
</table>

Depending on the model of care, cardiac surgery inpatient beds may be collocated with acute cardiac beds and may share facilities with these.

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>260.005.015</td>
<td><strong>BED NUMBERS</strong></td>
</tr>
<tr>
<td>603382</td>
<td>Coronary care bed numbers may vary from four to eight in small facilities and to twenty or more in large centres. These numbers will need to be determined at the service planning stage of the project.</td>
</tr>
<tr>
<td></td>
<td>In smaller units there may be a need to provide 'swing beds' (for example with adjacent ICU or HDU) to allow for expansion or contraction as the need arises.</td>
</tr>
</tbody>
</table>
260.005.020 BED MIX

CCU beds may be arranged in a mix of single and two-bed rooms. Depending on the model of care, the latter may be particularly appropriate for patients only in the Unit for short periods for post-procedure recovery.

All single bedrooms can accommodate patients requiring standard contact isolation, but in large centres at least one negative pressure (Type 5) single bedroom with anteroom should be considered for isolation purposes.

Acute cardiac and cardiac surgery beds may be a mix of single, two and/or four-bed rooms, and may also include a cardiac surgery high dependency unit.

Refer to Part B: HPU 340 Inpatient Accommodation Unit, Australasian Health Facility Guidelines (AHIA, 2010) for further information.

Operational Policies

260.006.000 GENERAL

The development of operational policies is integral to defining how the unit will operate within a healthcare facility or health service, as well as in relation to adjoining health services from where patients may be referred. They impact on the capital and recurrent costs of a facility will vary from unit to unit, depending on a wide range of factors such as the clinical characteristics of the patients, and the defined role of the unit. The cost implications of proposed policies should be fully evaluated to ensure the most cost-effective and efficient design solutions are developed in providing therapeutic and high quality physical environments.

Operational policies should be developed for every unit as part of the project planning process. Refer to Part B: Section 80 General Requirements, Australasian Health Facility Guidelines (AHIA, 2010) for further information.

The operational policies described below are unit specific.

260.006.005 CARDIAC REHABILITATION

Cardiac rehabilitation (CR) includes education in risk factor modifications (such as diet); counselling; and physical activity. Inpatient-unit based CR may involve specialist nursing staff, pharmacists, dieticians, clinical psychologists, physiotherapists and occupational therapists.

The involvement of physiotherapists and occupational therapists is occurs most in the outpatient setting. Programmes may be provided on a one-to-one basis or as group sessions.

260.006.010 Cardiac rehabilitation will be inpatient-unit based initially (education) with appropriate access, as indicated, to a cardiac gymnasium also used for outpatient rehabilitation. Refer to AushFG Part B: HPU 140 Allied Health Therapy Unit.

Although members of the multidisciplinary team the allied health staff should have access to workstations within the Unit.

260.006.020 MEDICAL IMAGING

Access will be required to medical imaging (MI) for a range of imaging needs including chest x-rays, CT, MRI, nuclear medicine and PET.

A mobile x-ray machine may be used for inpatients and will be located in the medical
imaging unit, unless a dedicated machine on the cardiac floor can be justified.

Echocardiography may be undertaken in the CCU at the bedside for those patients too sick to be transferred to the cardiac investigations unit. Equipment will be stored in the cardiac investigation unit.

260.006.025 PATHOLOGY
Pathology is extensively used by cardiac services and may be facilitated by point-of-care equipment (blood gas analyser) and pneumatic tube system in or near the CCU. This may be shared with an adjoining unit.

260.006.030 BEDSIDE MONITORING
Cardiac monitoring equipment should allow visual display at both the bed location and the staff station. Each coronary care bed should be individually monitored.

Monitors should be mounted so they are visible from the bedroom door, and staff should be able to assess the status of the patient at a glance. Their location should not interfere with physical access to the patient.

The addition of ‘slave’ monitors in corridors of larger units should be considered.

As the extent of monitoring equipment is likely to increase in the future, consider the need for increased space for equipment placement and storage, and the impact that extra demand that may place on the electrical supply capacity.

260.006.035 PROCEDURES
The range of procedures may include:
- PICC line (peripherally inserted central catheter) / central line insertion;
- arterial line insertion;
- transoesophageal echo;
- pericardiocentesis;
- intercostal catheter insertion;
- drain removal;
- cardioversion; and
- tilt table testing.

Some procedures may be undertaken in CCU bedrooms, others require a procedure room that may be better located in the cardiac investigation unit.

260.006.040 TELEMEDICINE
Telemedicine is the transmission of images, voice and data between two or more health units via telecommunication channels in order to provide clinical advice and consultation, education and training services. It has particular relevance for rural and remote areas.

Telemedicine links between community centres, ambulance units, emergency departments, cardiac units and the cardiac specialists' homes may considerably enhance the early diagnosis and ongoing treatment of patients.

All units should include information technology infrastructure to support this transfer of information.
260.006.045  **TELEMETRY**  
Telemetry (remote monitoring) is used for patients who do not require a bed in CCU, but do require monitoring. These patients may be in an adjoining inpatient unit, but telemetry may occur in any unit of the healthcare facility. The underlying concept is to take cardiac monitoring to the patient rather than the patient to the monitor.

Locate monitors in the CCU or at the cardiac inpatient unit staff station to ensure appropriate skilled observation.

260.006.050  **RENAL DIALYSIS**  
The provision of dialysis outlets, including a water supply and drainage, to an agreed number of coronary care beds will be determined on a project-by-project basis, in accordance with individual jurisdiction policies.

260.006.055  **STORAGE - EQUIPMENT**  
Only items in constant use for a particular patient should be stored in bedrooms, otherwise store nearby to bring in as required. Equipment storage may be in bays near point of use or in a central store for items used less frequently. Items may include:

- x-ray machine;
- resuscitation trolley;
- BiPAP and CPAP machines (non-invasive ventilation);
- ECG machine/s;
- intra-aortic balloon pump;
- IV stands and infusion pumps;
- procedure trolleys;
- transport defibrillators, transport packs and transport oxygen cylinders;
- battery chargers;
- walking aids; and
- mattresses, pillows and positional aids.

Consideration should be given to the storage of the resuscitation equipment for hospital medical emergencies, if located in the unit.

260.006.065  **VISITORS**  
CCU will have specific policies regarding visiting hours and accommodation for carers guided by the facility’s overall operational policies. Visitor amenities may include:

- visitor lounge with access to beverages;
- toilets and a shower for carers staying overnight;
- overnight bedroom/s;
- facilities for bedside sleeping; and
- interview and grieving / bereavement room/s.

260.006.070  **STAFFING**  
The development of a supported staff establishment early in the planning process should assist when planning for the allocation of office space, workstations and amenities.

Staffing levels may vary for each unit depending on the unit size; the operational policies; availability of staff and differing skill mix; levels of supervision required; clinical case mix and dependency; and unit activity levels.
Provision should be made for sufficient functional areas to support the number of staff in the safe and efficient delivery of care.

The environment should be secure and facilitate effective emergency responses to acute situations on each shift. Designing the unit on this basis will support efficient unit operation without imposing additional costs, whilst enabling compliance with security and OHS requirements.

Unit staff may include (on a permanent and visiting basis):
- cardiology specialists and VMOs;
- registrars and junior medical officers;
- nurse manager;
- nurse practitioner;
- clinical nurse consultant;
- clinical nurse educator;
- general nursing staff;
- cardiac rehabilitation nurse;
- allied health staff;
- case managers;
- ward clerk;
- technicians and other support / hospitality personnel; and
- students - medical, nursing and allied health.

Planning Models

**260.007.000 LOCATION**

Locate the CCU in a quiet location that avoids or minimises:
- disturbing sounds (ambulances, traffic, sirens);
- disturbing sights (morgue, cemeteries, etc); and
- problems associated with prevailing weather conditions (excessive wind, sun exposure, etc.).

The location should enable expansion if additional beds are required in the future.

In all instances, by good design and location, the potential for appropriate sharing of facilities with an adjoining unit should be maximised.

Ensure that the CCU and adjoining units do not act as a thoroughfare to other parts of the healthcare facility.

**260.007.005 LAYOUT**

All coronary care beds should ideally be visible from the staff station. In larger units, where this cannot be achieved, consideration may be given to providing decentralised staff / work stations with computer support.

However, all units require a central staff station with central monitors showing cardiac rhythms of all patients (as well as ‘slave’ monitors) to assist with discussion, education and interaction between staff.
Functional Areas

260.008.000  FUNCTIONAL ZONES
The following features will be required in a CCU. Some will be CCU-specific and some facilities may be shared:
- inpatient areas and dedicated clinical support areas; and
- staff offices and amenities.

260.008.005  INPATIENT AND CLINICAL SUPPORT AREAS
Inpatient accommodation in the CCU may comprise:
- a mix of single and two-bed rooms;
- showers and toilets;
- staff station;
- clean utility room;
- medication room - a secure room with visibility into the unit;
- equipment bay;
- linen trolley bay/s;
- storage; and
- visitor lounge and/or distressed relatives room.

260.008.010  CCU BEDROOM
Refer to Standard Components - Room Data Sheets (RDS) and Room Layout Sheets (RLS), Australasian Health Facility Guidelines (AHFA, 2015) for single and two-bed rooms.

260.008.015  ENSUITE SHOWERS AND TOILETS
Determine on a project by project basis the provision of individual en suite showers / toilets to patient bedrooms for the following reasons:
- many patients are transferred out of the unit as soon as they are past the critical phase and are ambulant;
- patients may only be in the unit for a few hours recovering from a procedure but may require access to a toilet and shower before discharge; and
- the provision of en suites increases the overall size of the unit and subsequent capital costs.

Care should be taken that when an en suite is provided that its location does not inhibit patient observation, both directly and via bedside monitors.

260.008.020  ACUTE CARDIAC AND CARDIAC SURGERY INPATIENT UNIT
In most respects, an acute cardiac and cardiac surgery inpatient unit will be the same as a general medical or surgical inpatient unit with the following additions:
- a procedure room with access for a bed and image intensifier if required (this room is optional);
- telemetry equipment and antenna with monitoring at a staff station that may be in the CCU or in the main ward staff station; and
- access to patient education facilities.

260.008.025  DAY PROCEDURE HOLDING / RECOVERY BEDS
Unless beds in the catheter laboratory, or a day procedure, or 23 hour unit are utilised,
the CCU or the acute ward may cater for the recovery of patients following cardiac procedures such as echocardiography; angiography; percutaneous coronary intervention; temporary and permanent pacemaker insertion; cardiac catheterizations and transoesophageal echos (TOE).

260.008.030 STAFF OFFICES AND AMENITIES
Staff offices and amenities will be dictated by staff establishment and may include:
- offices and workstations;
- staff room / beverage bay;
- showers and toilets; and
- property storage.

Provide staff toilets and small lockers that are immediately accessible within the envelope of the CCU.

Provide office space / workstations in accordance with each jurisdiction’s office accommodation policies.

260.008.035 SHARED AREAS
The extent of room/s or spaces that may be shared between CCU and an adjoining inpatient unit or ICU should be determined by the size of the overall CCU itself. Large units may be entirely self-contained with regard to clinical spaces, but may still share some staff amenities and teaching spaces. However, consider the following with regard to potential for sharing:
- clean and dirty utility rooms;
- central equipment storage;
- beverage pantry / kitchen;
- reception / ward clerk;
- cleaners' room;
- disposal room;
- visitor waiting;
- public toilets;
- staff education / training room; and
- staff amenities (shower, toilets, locker room and rest area).

260.008.040 EDUCATION AND STAFF DEVELOPMENT
Unit planning should ensure access to adequate facilities for staff education and meetings.

In larger units staff require access to simulation training and competency assessment, with suitable audiovisual equipment in a training room for use by the multidisciplinary team.

260.008.045 RESEARCH
Research associated with the provision of all cardiac services for CCU and cardiac inpatient units may be undertaken. Spatial provision in the CCU for research, may be justified by service needs and role delineation.

The following facilities may be required for clinical trials, or shared with other cardiac units (including cardiac investigation unit) depending on jurisdictional office accommodation policies:
- offices for senior coordinator/s and research fellow/s;
- shared offices / workstations for other clinical trial research staff;
- shared offices / workstations for registrars and research assistants;
- patient consulting room/s (if the unit is patient-accessed);
- drug monitoring room;
- drugs and research files storage; and
- research laboratories.

**Functional Relationships**

**260.009.000**  
603412 EXTERNAL

The CCU will have working relationships with many other units & services including:
- cardiac investigation unit;
- cardiac catheter unit;
- Hospital in the Home services - for chronic diseases such as heart failure;
- cardiac rehabilitation services;
- emergency unit;
- nuclear medicine / PET;
- intensive care unit;
- operating (suite) unit including recovery;
- medical imaging;
- pathology; and
- biomedical engineering.

**260.009.005**  
603413

Linkages to cardiac surgery occur at several operational levels including clinical decision making regarding patients requiring cardiac surgery; joint research projects; and joint management of patients in the post-operative phase including rehabilitation. The unit needs to be well-linked, but not necessarily collocated.

**260.009.010**  
603414 INTERNAL

Optimal internal relationships to be achieved include those between:
- patient occupied areas forming the core of the unit;
- staff station(s) and associated areas that need direct access and observation of patient areas;
- utility and storage areas that need to be readily accessible to both patient and staff work areas;
- public areas located on the perimeter of the unit; and
- shared areas that should be easily accessible from the units served.
DESIGN

Access

260.010.000 EXTERNAL

Provide:
- a separate discrete entry from and to the ward for movement of inpatients
- easy access to the lifts from emergency unit and chest pain assessment unit
- ready access to and from the cardiac catheter laboratory.

Ideally, there should be a separate entry/s for staff and goods and supplies, operated by swipe card or similar to authorised personnel only. A separate entry for patients on beds or trolleys may also be considered.

260.010.005 INTERNAL

There should be only one point of public entry, manned by a ward clerk / receptionist to:
- monitor and / or prevent access by visitors depending on the patient’s condition;
- advise visitors if patients have been moved or are out of the unit for any reason;
- monitor visiting staff and direct them to the appropriate staff member or patient; and
- monitor patient movements in and out of the unit.

Parking

260.011.000 For staff parking, refer to Part C: Section 790, Safety and Security Precautions, Australasian Health Facility Guidelines (AHIA, 2015) for further information.

Disaster Planning

260.012.000 Each site and unit will have operational plans and policies detailing the response to a range of emergency situations both internal and external. Consider issues such as the placement of emergency alarms; the need for uninterrupted power supply (UPS) to essential clinical equipment and electronic sensor taps; services such as emergency lighting; telephones; duress alarm systems and computers; and the emergency evacuation of patients, many of whom will require assistance.

A number of items (e.g. duress alarms, central computer, nurse call) require connection to a UPS and a generator to provide continuous power between the time of power failure and the time it takes the generator to provide electricity; otherwise systems have to be re-set and/or do not function during a power failure. The importance of a UPS may not be fully appreciated during procurement / construction.

Infection Control

260.013.000

The following aspects of planning and design contribute to the implementation of effective infection prevention and control measures and are relevant within the context of this HPU:

- hand hygiene facilities;
- provision for the isolation of patients with infectious diseases;
- linen handling;
- separation of ‘clean’ and ‘dirty’ work flows;
- storage;
- waste management; and
- surface finishes.

Refer to Part D: Infection Prevention and Control, Australasian Health Facility Guidelines [AHIA, 2015] and individual jurisdiction policies and guidelines for further details.

260.013.005

Determine on a project by project basis the need for a negative pressure isolation room. Relevant factors for inclusion are: the size of the unit; its location; special needs; and role delineation. It is recommended that tertiary units and units in regional settings have a negative pressure isolation room.

260.013.010

A hand basin should be incorporated at the entry to the unit, and in all clinical areas including:

- bedrooms;
- treatment rooms;
- procedure rooms;
- clean and dirty utility rooms
- medication room; and
- staff station if used for any medication preparation.

Environmental Considerations

260.014.000

ENVIRONMENTALLY SUSTAINABLE DESIGN

Sustainability applies to many areas such as:

- air handling and ventilation;
- thermal integrity (insulation, etc);
- water management;
- choice of sustainable products e.g. low VOC floor finishes; and
- support of operational recycling policies.

Many of these issues will be addressed at overall facility level but may have greater or lesser implications for this HPU.

260.014.005

ACOUSTICS

add to the sensory overload in critical care units. Without reducing their importance or sense of urgency, such signals should be modulated to a level that will alert staff, yet be rendered less intrusive. For these reasons, surfaces that absorb sound should be used
while keeping infection control, maintenance and equipment movement needs under consideration.

260.014.010  NATURAL LIGHT
Daylight to all bedrooms is essential. Daylight to patient lounge areas and staff rooms is desirable.

260.014.015  PRIVACY
Visual privacy is required for patients, but the higher priority is the requirement for staff to be able to see patients and observe their condition.

260.014.020  INTERIOR DÉCOR
Interior décor includes furnishings, style, colour, textures, ambience, perception and taste. This can help prevent an institutional atmosphere. However, cleaning, infection control, fire safety, patient care and the patients' perceptions of a professional environment should always be considered.

Some colours, particularly the bold primaries and green should be avoided in areas where clinical observation occurs such as bedrooms and treatment areas. Such colours may prevent the accurate assessment of skin tones e.g. yellow / jaundice, blue / cyanosis, red / flushing.

A calming non-threatening environment is desirable using colours that do not mask skin colours. Consideration could be given to ceiling art and murals.

Space Standards and Components

260.015.000  HUMAN ENGINEERING
Human engineering covers those aspects of design that permit effective, appropriate, safe and dignified use by all people, including those with disabilities. For details refer to Part C: Section 730, Human Engineering, Australasian Health Facility Guidelines (AHIA, 2010).

As the requirements of occupational health and safety (OHS) and antidiscrimination legislation will apply, this section should be read in conjunction with Part C: Section 790, Safety and Security Precautions, Australasian Health Facility Guidelines (AHIA, 2015) in addition to relevant OHS legislation.

260.015.010  ACCESS AND MOBILITY
Planning should allow for a ceiling mounted hoist to a nominated number of beds. This is in response to an increase in bariatric patients and ‘no lift policy’ for patients who may be on a balloon pump or otherwise on complete bed rest.

Refer to Part C: Section 730, Human Engineering, Australasian Health Facility Guidelines (AHIA, 2010) for details.
**BUILDING ELEMENTS**

Building elements include walls, floors, ceilings, doors, windows and corridors and are addressed in detail in the section on Building Elements in Part C: Section 710, Space Standards and Dimensions, Australasian Health Facility Guidelines (AHIA, 2010).

**Window sill heights** should be low enough to permit a view to the outside by a patient lying in bed. This is usually 600 millimetres above the finished floor level.

**Doorways** should be sufficiently wide and high enough to permit the manoeuvring of beds, wheelchairs, trolleys and equipment without risk of damage or manual handling risks, particularly in rooms designed for bariatric patients.

**Corridor widths** should accommodate a bed with associated equipment and escorts.

---

**Safeguard and Security**

**RISK / HAZARD MANAGEMENT**

Consideration of safety and security risks should begin during the planning and design phase of a healthcare facility and should continue to be considered during the construction, use and post occupancy stages.

Safety considerations need to address the health and safety of the end users, including staff, maintenance personnel, patients, visitors, and those involved in construction.

A safety audit, via a risk analysis, of potential hazards should be undertaken at every stage.

**SIGNAGE**

‘X-Ray in use’ sign should be located outside the Procedure Room if an x-ray machine is being used in the room.

**SECURITY**

Security of the various components/zones should be addressed at each stage of the planning and design process and not imposed on a completed building.

Aspects of security may include:

- the need for fixed and/or personal duress alarms;
- access control particularly at night;
- control and monitoring of visitors;
- monitoring of patient movements into and out of the unit;
- the ability of the design to facilitate emergency responses to threat such as bomb or personal threats; and
- video surveillance.

For further information refer to individual jurisdiction policies and to:

- individual jurisdiction security policies where available; and

**RISK MANAGEMENT**
Occupational Health and Safety (OHS) legislation requires designers to identify, assess and control risks in order to provide an optimal ergonomic design and to do this in consultation with stakeholders.

Safety considerations need to address the health and safety of end users, including staff, maintenance personnel, patients and visitors.

By adopting a risk management approach, many safety and security related hazards can be eliminated or minimized at the planning stage before work even begins, reducing the likelihood of adverse incidents occurring.

For further details refer to:
- Part C: Section 730, Human Engineering, Australasian Health Facility Guidelines (AHIA, 2010) and Part C: Section 790, Safety and Security Precautions, Australasian Health Facility Guidelines (AHIA, 2015) for specific OHS requirements;
- AS/NZS 4360:2004 Risk Management (Standards Australia, 2004);
- TS11 - Engineering Services and Sustainable Development Guidelines (NSW Health, 2013); and

**Finishes**

260.017.000

**GENERAL**

Finishes in this context refers to walls, floors, windows and ceilings.

Refer to Part C: Section 710, Space Standards and Dimensions, Australasian Health Facility Guidelines (AHIA, 2010) for further details.

260.017.005

**WALL FINISHES**

Adequate wall protection should be provided to areas that will be regularly subjected to damage. Particular attention should be given to areas where bed or trolley movement occurs such as corridors, bed head walls, treatment areas, equipment and linen trolley bays. Refer to Part C: Section 710, Space Standards and Dimensions, Australasian Health Facility Guidelines (AHIA, 2010).

260.017.010

**FLOOR FINISHES**

The selection of floor finishes should be appropriate to the function of the space and take into account manual handling issues including the impact of the flooring on push / pull forces for wheeled equipment.

Consider acoustic performance, slip resistance, consequences of patient falls, infection control, movement of beds and trolleys, maintenance and cleaning protocols. The flooring selected should be adequate to avoid the potential for slips, trips and falls to occur, including as a result of joints between flooring.

Refer to:
- Part D: Infection Prevention and Control, Australasian Health Facility Guidelines (AHIA, 2015);
- TS7 - Floor Coverings in Healthcare Buildings, Issue V1.1 (NSW Health, 2009); and
- Part C: Section 710, Space Standards and Dimensions, Australasian Health Facility Guidelines (AHIA, 2010).
CEILING FINISHES

Ceiling finishes should be selected with regard to appearance, cleaning, infection control, acoustics and access to services.

Refer to Part C: Section 710, Space Standards and Dimensions, Australasian Health Facility Guidelines (AHIA, 2010).

Fittings and Fixtures

DEFINITIONS

The Room Data and Room Layout Sheets in the Australasian Health Facility Guidelines define fixtures and fittings as follows.

- **Fixtures**: Items that require service connection (e.g. electrical, hydraulic, mechanical) that include, but are not limited to hand basins, light fittings, medical service panels etc. but exclude fixed items of serviced equipment; and

- **Fittings**: Items attached to walls, floors or ceilings that do not require service connections such as curtain and IV tracks, hooks, mirrors, blinds, joinery, pin boards etc.

Refer to Part C: Section 710, Space Standards and Dimensions, Australasian Health Facility Guidelines (AHIA, 2010) and to the Standard Components - Room Data Sheets (RDS) and Room Layout Sheets (RLS), Australasian Health Facility Guidelines (AHIA, 2015) for further detailed information.

Also refer to Part F: Section 680 Furniture Fittings and Equipment, Australasian Health Facility Guidelines (AHIA, 2010) regarding fixtures, fittings and equipment.

Building Service Requirements

GENERAL

In addition to topics addressed below, project staff may also refer to:

- Part E: Building Services and Environmental Design, Australasian Health Facility Guidelines (AHIA, 2010) and

AIR HANDLING SYSTEMS

Approach the provision of natural ventilation to patient care areas with caution. The management of airflows and the creation of a stable environment are essential to the control of the spread of infection. Generally air-conditioning should be provided.

ELECTRICAL SERVICES

It is essential that services such as emergency lighting, telephones, duress alarm systems (including the central computer) and electronic locks are connected to the emergency power supply.

Other electrical services that are required include:

- emergency power supply for critical equipment;
- cardiac protection to coronary care bedrooms and procedure room (if a procedure room is provided);
- some rooms in the cardiac inpatient unit require cardiac protection for patients with temporary transvenous / epicardial pacing wires;
- cardiac protection - using core balance devices (CBD) or live isolation; and
- surge protection to electronic equipment to ensure that critical data is not lost.

For further information refer to:

- AS/NZS 3003:2011 Electrical Installations - Patient Areas (Standards Australia, 2011); and

**260.019.020 HYDRAULIC SERVICES**

The CCU and inpatient area will require temperature controlled water. Water saving devices should be considered.

Dialysis outlets will be provided according to service level and role delineation.

Refer also to Part E: Building Services and Environmental Design, Australasian Health Facility Guidelines (AHIA, 2010), Section 5, Hydraulics, for further details.

**260.019.025 LIGHTING**

Provide adjustable examination lamps as well as task lighting at the head and foot of each bed.

**260.019.030 MEDICAL GASES**

Medical gases may be located on wall-mounted service panels, on vertical columns or on ceiling-mounted pendants.

Where inpatient en suites are provided, provision should be made for oxygen and suction outlets.

Refer also to:

- Part E: Building Services and Environmental Design, Australasian Health Facility Guidelines (AHIA, 2010), Section 6; and
- Standard Components - Room Data Sheets (RDS) and Room Layout Sheets (RLS), Australasian Health Facility Guidelines (AHIA, 2015).

**260.019.035 TELEMETRY**

Telemetry is the transmission of signals to a receiving location via a radio signal, where they are displayed for monitoring purposes.

Telemetry may be helpful for people who:

- are having chest pain or angina;
- have had fainting episodes (syncope) that could be caused by a heart problem;
- have had heart or lung surgery;
- have had a procedure that may cause the potential for irregular heart rhythms, (i.e.: cardiac catheterization, angioplasty or stent insertion);
- have a known or suspected heart or lung disease;
- have had or suspected irregular heart rhythms or heartbeats;
- have a pacemaker/ automatic implantable cardioverter defibrillator (AICD) that needs to be checked; or
- are taking medications that change heart rhythms and rates

260.019.040 The CCU and cardiac inpatient step down areas will require a telemetry monitoring system consisting of (but not limited to) the following:
- sensors appropriate to the particular signals to be monitored;
- battery powered, patient worn transmitters;
- a radio antenna and receiver; and
- a display unit (monitor) capable of concurrently presenting information from multiple patients.
COMPONENTS OF THE UNIT

Standard Components

<table>
<thead>
<tr>
<th>260.020.000</th>
<th>603453</th>
</tr>
</thead>
</table>

Standard Components (SC) refer to rooms / spaces for which Standard Components - Room Data Sheets (RDS) and Room Layout Sheets (RLS), Australasian Health Facility Guidelines (AHIA, 2015) have been developed and are available on the AusHFG website. Their availability is indicated by “Y” in the SC column of the Schedule of Accommodation.

Standard components are provided to assist with the development of a project. Their use is not mandatory and if used they can be edited to be project specific.

Refer to AusHFG Part B: Section 90, Standard Components for the text and to separately itemised Standard Components - Room Data Sheets (RDS) and Room Layout Sheets (RLS), Australasian Health Facility Guidelines (AHIA, 2015).

Non-Standard Components

<table>
<thead>
<tr>
<th>260.021.000</th>
<th>603454</th>
</tr>
</thead>
</table>

Non-standard components are unit-specific and provided in accordance with specific operational policies and service demand.

<table>
<thead>
<tr>
<th>260.021.005</th>
<th>603455</th>
</tr>
</thead>
</table>

All the rooms/spaces in the schedule of accommodation appear as standard components but may need some slight modification such as electrocardiogram (ECG) monitor/printer at the staff station.
### Schedule of Accommodation

**260.022.000** A schedule of accommodation is shown below and lists generic spaces for this HPU. Quantities and sizes of spaces will need to be determined in response to the service needs of each Unit on a case by case basis. Note that:

- **SC** = standard component (drawings and data sheets)
- "Y" refers to whether available in these guidelines.
- "O" refers to whether optional.
- "*" refers to where there is a minor variation to the standard component.

**260.022.005** A schedule is provided for an eight (8) bedded CCU, noting that an eight bed unit may share many rooms / spaces with an adjoining unit. Larger units may be self-contained.

**260.022.010** **CORONARY CARE UNIT (8 BED UNIT)**
